Abstract

The Internet is often referred to as the Information superhighways. In a sense, it is like a highway that connects you to millions of other people and organizations. Competent and knowledgeable end users enjoyed the resources available on the Internet and Web. This paper examined Internet connectivity of Information Technology firms in Minna metropolis. Questionnaires were administered to ten selected Information Technology firms. All the selected firms are connected (100%). Also, all the firms use Internet Explorer as their browser (100%). The level of patronage is of average, while the major threat to their operations is power failure.
